

ABSTRACT

1  
2 The instant invention involves the use of a combination  
3 of preparatory steps in conjunction with mass spectroscopy  
4 and time-of-flight detection procedures to maximize the  
5 diversity of biopolymers which are verifiable within a  
6 particular sample. The cohort of biopolymers verified within  
7 such a sample is then viewed with reference to their ability  
8 to evidence at least one particular disease state; thereby  
9 enabling a diagnostician to gain the ability to characterize  
10 either the presence or absence of said at least one disease  
11 state relative to recognition of the presence and/or the  
12 absence of said biopolymer.
